POLICE LABORATORY REPORT ON SEDIMENT SAMPLES OBTAINED FROM SUSPECT 2

Suspect Two – Professor Giles Johnson

Giles claims to have spent all day observing and collecting rare plants at Location 2: BNG 324639 381921.

He returned to camp at approximately 1800.

Samples were collected from:

- Beach at Location 2 [S2A]
- The legs of his field trousers [S2B]
- Underneath his fingernails [S2C]

Parts from *Spartina anglica* and *Salicornia europaea* were also found in his field bag

Sample Descriptions:

You have been given the descriptions for S2A and S2C – you need to write the description for S2B

	Sample S2A	Sample S2B	Sample S2C
Grain shape	Rock (lithic) grains: subspherical-discs Shelly material: irregular rods, some branching	Mineral grains: Shelly material: Rock (lithic) grains:	Mineral grains: spherical-subspherical Shelly material: variable depending on type and size (plates, rods, subsphericial) Rock (lithic) grains subsphericalplatey
Angularity	Shelly material: subrounded-rounded Rock (lithic) grains: angular-subangular		Shelly material: rounded-well rounded Mineral grains: subangular-subrounded
Composition	49% *Corallina* (coralline algae) 33% limestone 17% disarticulated shell fragements (gastropods incl. Viviparus 1% whole bored Turritella (gastropod sp.) b/n 3-9 mm in length		50% quartz 48% shelly material incl. in order of relative abundance: shell fragments (bivalves and gastropods), whole gastropods (3 types), disarticulated bivalves, forams (2 types), bryozoa (2 types), echinoid spines (green and purple), and fish teeth. 2% basic igneous (including basalt) and metamorphosed basic intrusive igneous
Other observations			Polished shell fragments- high degree of abrasion
