Outcrop overview

Unit 1: Oolitic member

Study the following images.
What were depositional processes and environment for this unit?

Identify macroscopic grain types (1.1 and 1.2), and sedimentary structures (1.2 to 1.4).

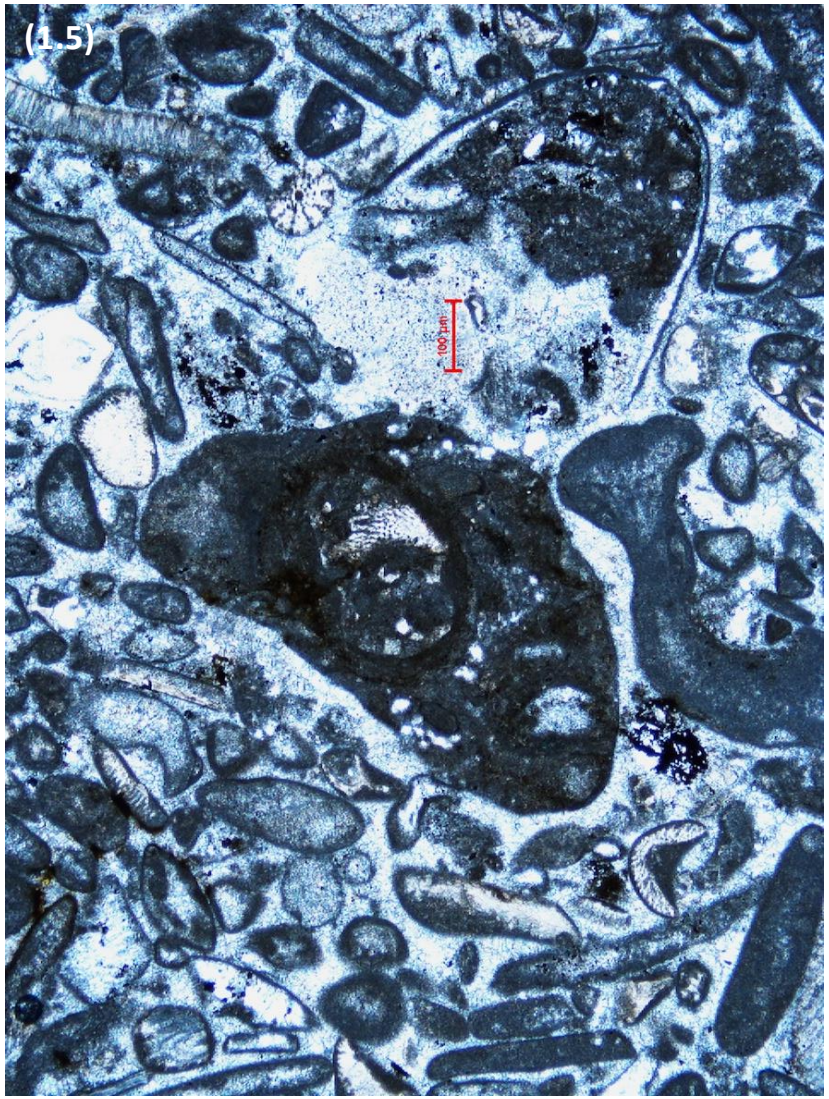

ooids

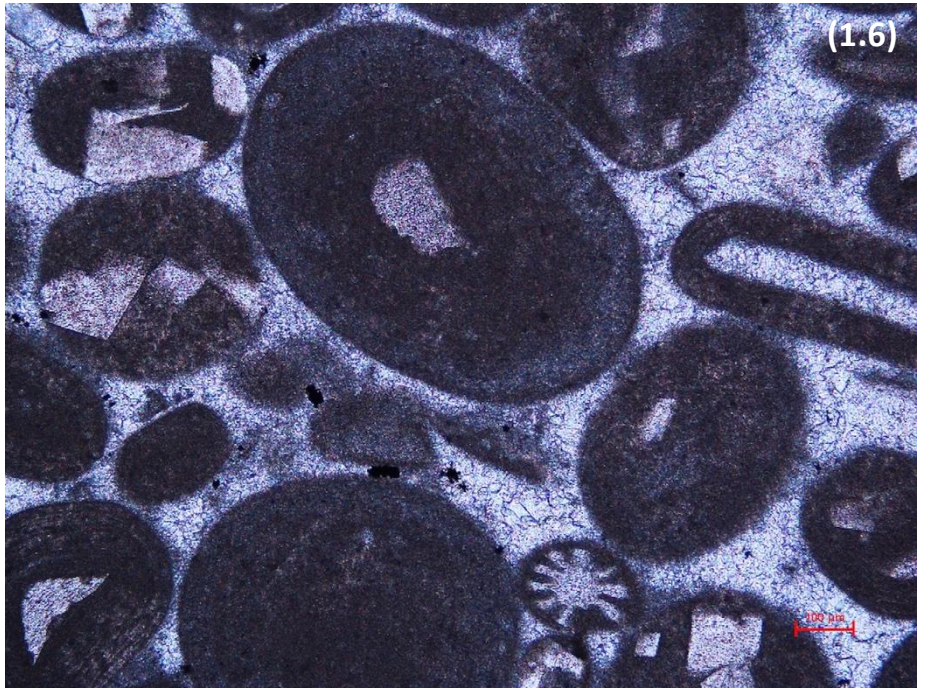

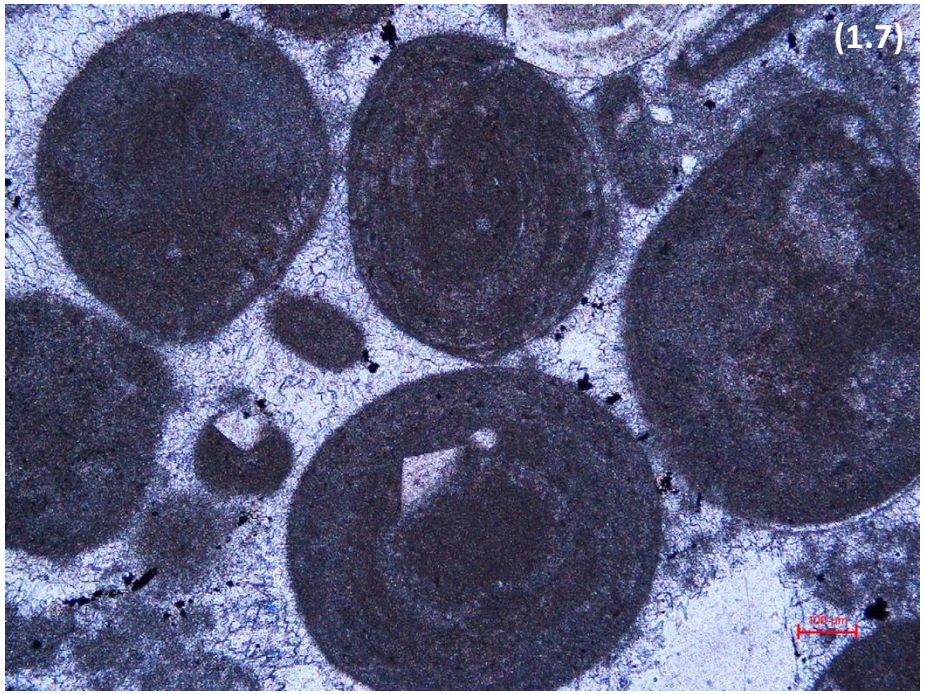

Identify macroscopic grain types (1.1 and 1.2), and sedimentary structures (1.2 to 1.4).

Cross bedding – some possibly epsilon (reverse flow) – tidal (right image)

Study the images on the left and the HS/TS provided:
AS13
L149
L298

Identify grain types.
Sparite or micrite between grains?
What Dunham texture/name?

Ooids, aggregate grains, micritized grains (shell fragments, some echinoderm nuclei
Oolitic/bioclastic grainstone

Summarize your observations on this unit:
- What environmental information is contained within the various grains?
- Overall, what environment is likely?

Fairly high energy (aggregate grains may be somewhat lower) to winnow micrite and fragment bioclasts; micritization common – carbonate shoal (tidal shoal?)
