UNIVERSITY OF MANCHESTER

STRUCTURAL GEOLOGY

Date: whatever

Time: whatever

Duration: 1 hour

In an area of large-scale folding the following data was collected from around an **antiform**:

bedding: 019/30SE, 118/V, 049/31SE, 100/60S, 102/63S, 039/30SE, 130/70NE, 149/48NE, 043/30SE, 109/70S, 033/29SE, 104/66S, 175/34E, 112/80S

minor fold axes: 28/117, 32/117, 27/120, 31/121

trend of a cleavage which is axial planar to the minor folds: 081°

By plotting a stereogram fully describe the geometry of the fold and draw a simplified profile plane section to illustrate that geometry. The marking scheme is exactly as described in the in-class exercises of this kind.
