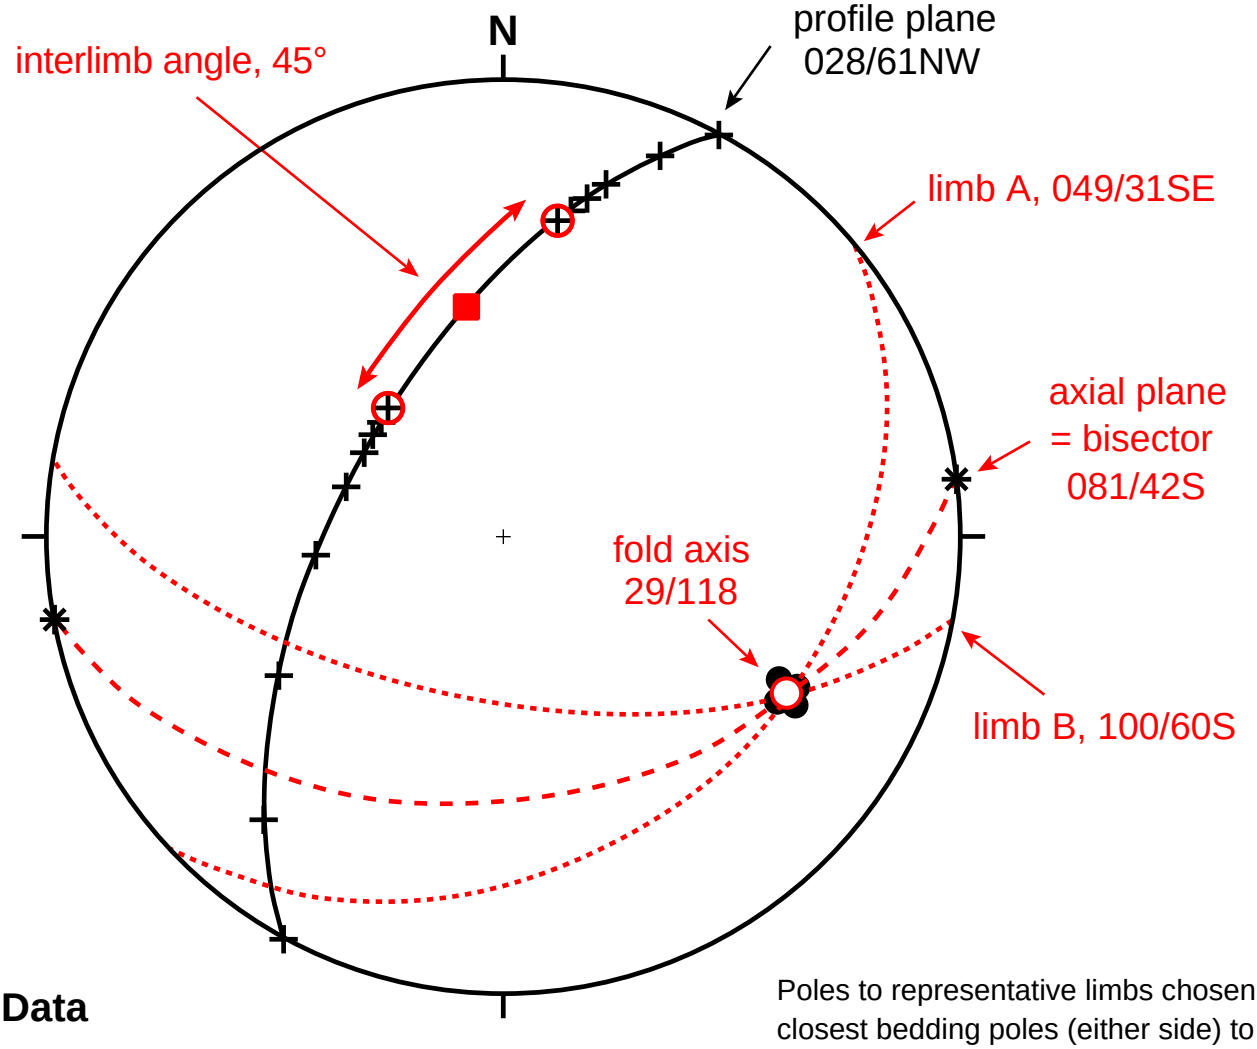
FOLDS ON STEREOGRAMS



Data

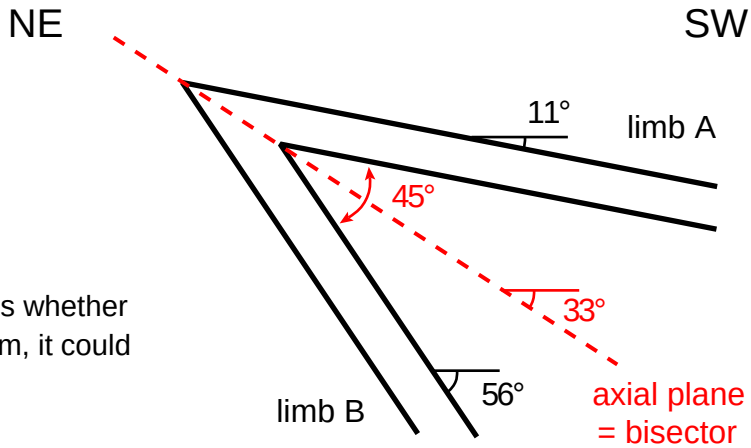
- \+ poles to bedding
- ✱ trace of axial planar cleavage
- ● minor fold axes

Poles to representative limbs chosen as the closest bedding poles (either side) to the pole to the axial plane; poles to real data generally do not lie on such a good great circle, and typically there are two clusters of bedding poles corresponding to the orientation of each limb − in this case choose an average pole for each cluster which lies on the profile plane

Interpretation

- ○ fold axis
- ⊕ poles to limbs
- ■ pole to axial plane (= pole to bisector)

simplified profile plane (028/61NW)
section looking down-plunge



Unless it is known by other means whether the fold is an antiform or a synform, it could equally well be drawn as either
