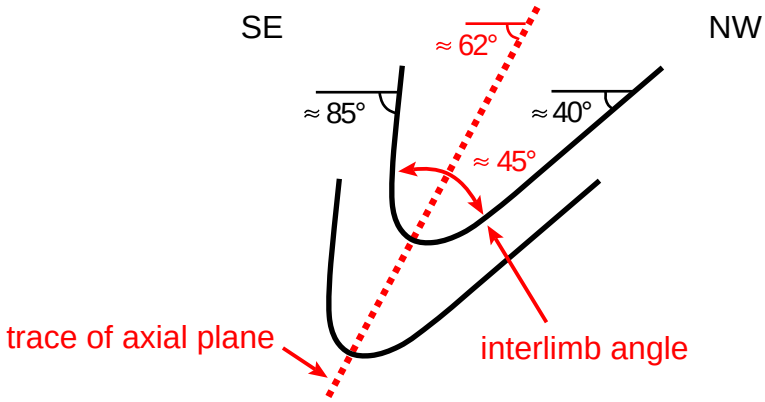
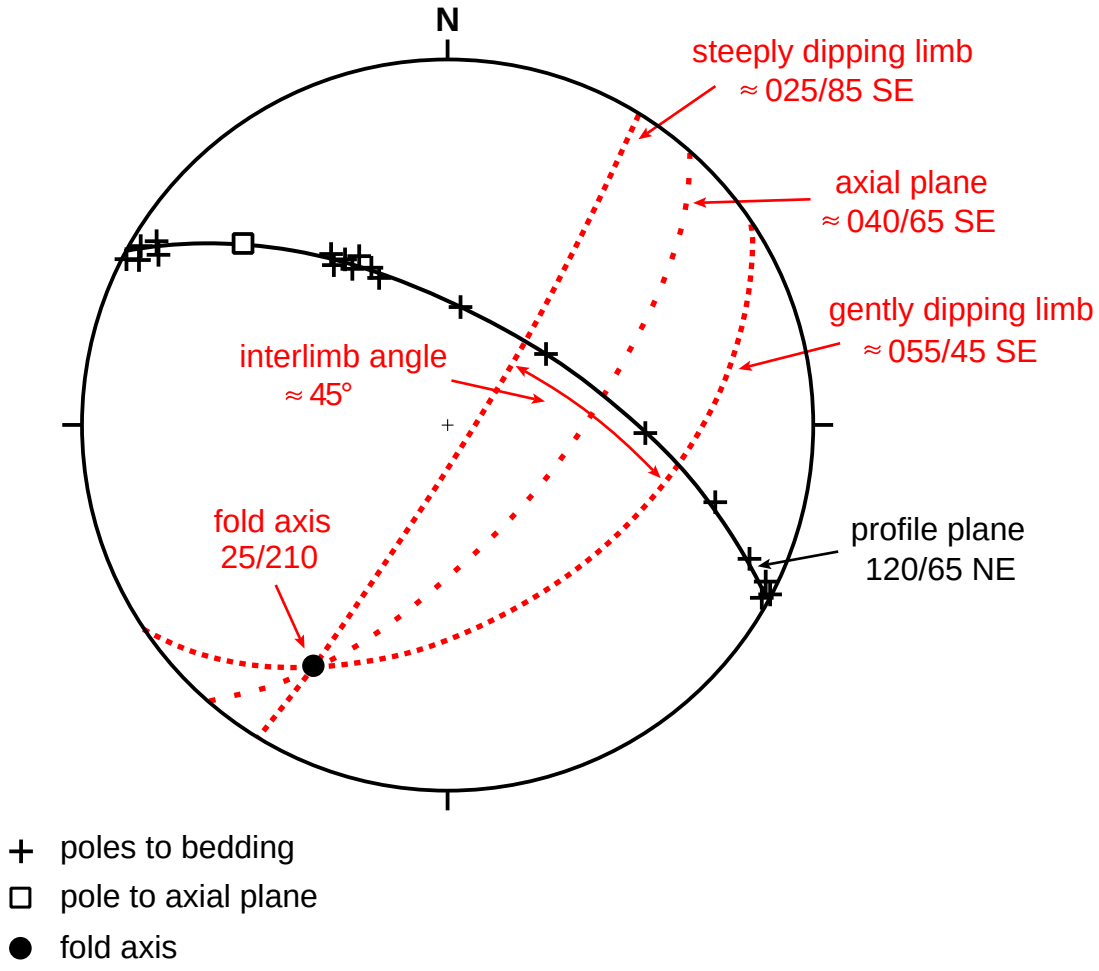
FOLDS ON STEREOGRAMS

The diagram below (top) shows the general appearance of a cylindrical fold when viewed down-plunge. The fold plunges 25/210.

(a) On the down-plunge view draw the axial trace and indicate the interlimb angle.




(b) On the blank circle below (bottom) sketch where you would expect the poles to about twenty measurements of bedding around the fold to appear on a stereogram. Sketch in and label the profile plane, the position of the fold axis, the position of the pole to the axial plane, and the interlimb angle. Complete the exercise by drawing in great circles showing the orientation of two representative limbs, and the axial plane.
