UNIVERSITY OF MANCHESTER

STRUCTURAL GEOLOGY

Date: 9 February 2017

Time: 1 pm

Duration: 1 hour

In an area of large-scale folding the following data was collected from around a **synform**:

bedding: 086/37S, 109/59S, 125/V, 128/85NE, 131/79NE, 132/76NE, 133/73NE, 004/29E, 008/28E, 013/27E, 017/26E, 049/26SE

minor fold axes: 26/123, 24/128, 27/126, 23/125

trend of a cleavage which is axial planar to the minor folds: 140°

By plotting a stereogram fully describe the geometry of the fold and draw a simplified profile plane section to illustrate that geometry. The marking scheme is exactly as described in the in-class exercises of this kind.
