FAULT EXERCISE

(1) Formation of the country rock

(2) Intrusion of dyke

Intrusion of a 24 m wide, parallel-sided dyke (discordancy is actually unknown because the orientation of the surfaces in the country rock are unknown), contacts 015/41W, with an unknown opening direction

(3) Faulting − F_1 (crosscuts dyke and hence post-dates it)

Formation of an oblique-slip fault, oriented 150/58SW, slip vector 24/167 and magnitude 135 m (117 m dextral strike-slip, 68 m reverse dip-slip)

(4) Intrusion of pegmatite (crosscuts and offsets F_1 and hence post-dates it)

Intrusion of a 14 m wide, parallel-sided pegmatite, contacts 070/31S, with an opening direction normal to its margins (in map view), *i.e.*, 160°/340°

(5) Faulting − F_2 (offsets pegmatite and hence post-dates it)

Formation of an oblique-slip fault, oriented 030/50NW, slip vector 21/228 and magnitude 693 m (612 m sinistral strike-slip, 325 m normal dip-slip)

(6) Uplift and erosion to the present topography
