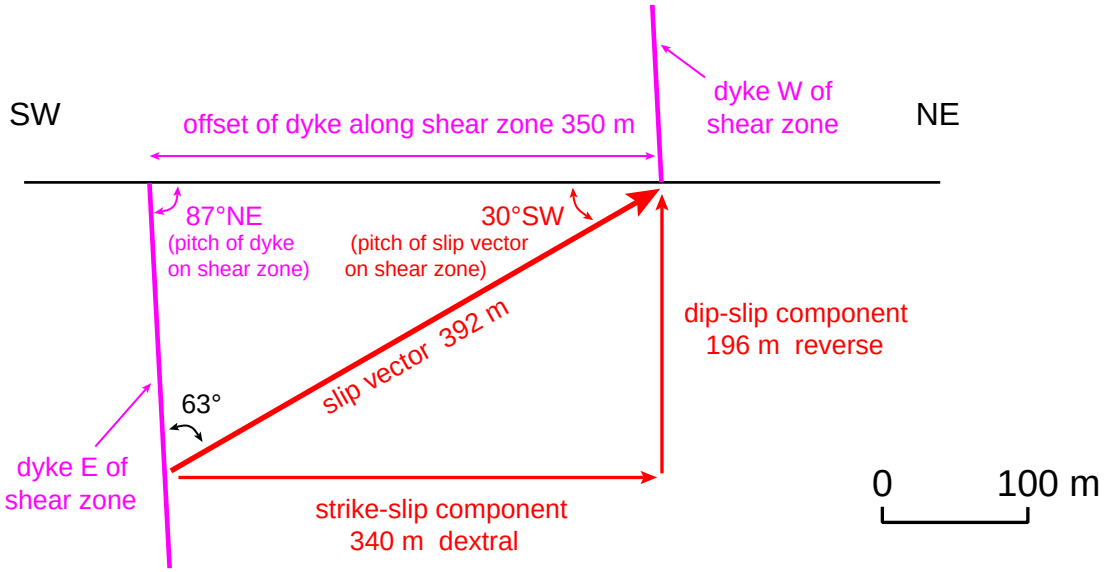
SHEAR ZONE EXERCISE

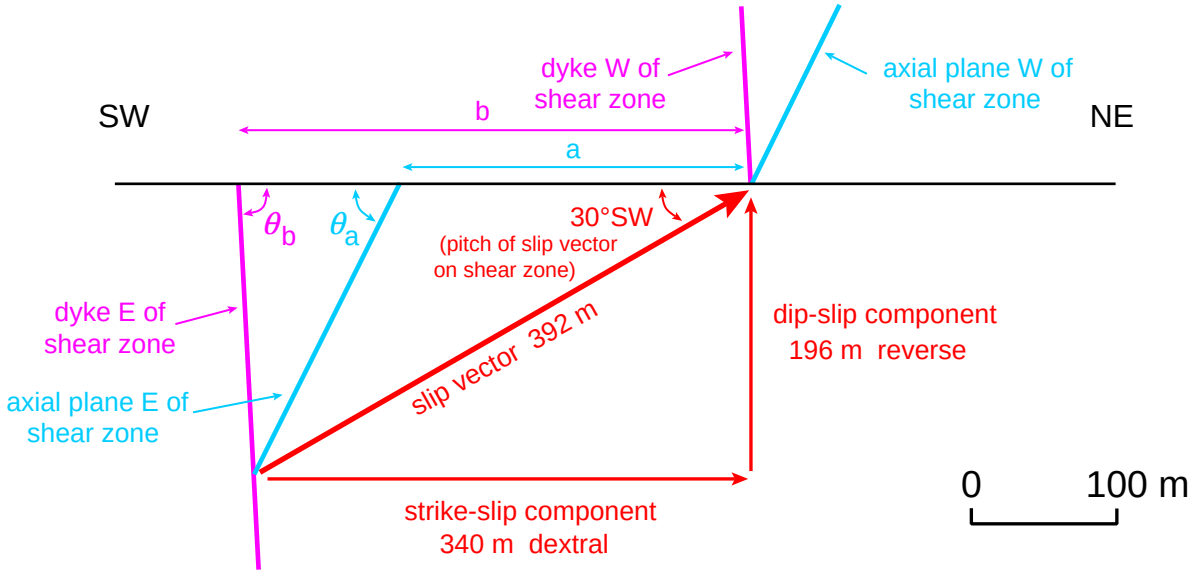
fault plane (023/87 W) section



Instead of using the offset of the dyke, the offset of the F_1 axial traces could have been used.

Alternatively, the problem could have been solved without knowledge of the orientation of the slip vector by using the offsets of the dyke and F_1 axial traces :

fault plane (023/87 W) section



θ_a = pitch of axial plane on shear zone (64°SW)

θ_b = pitch of dyke on shear zone (87°NE)

a = offset of axial plane along shear zone (240 m)

b = offset of dyke along shear zone (350 m)
