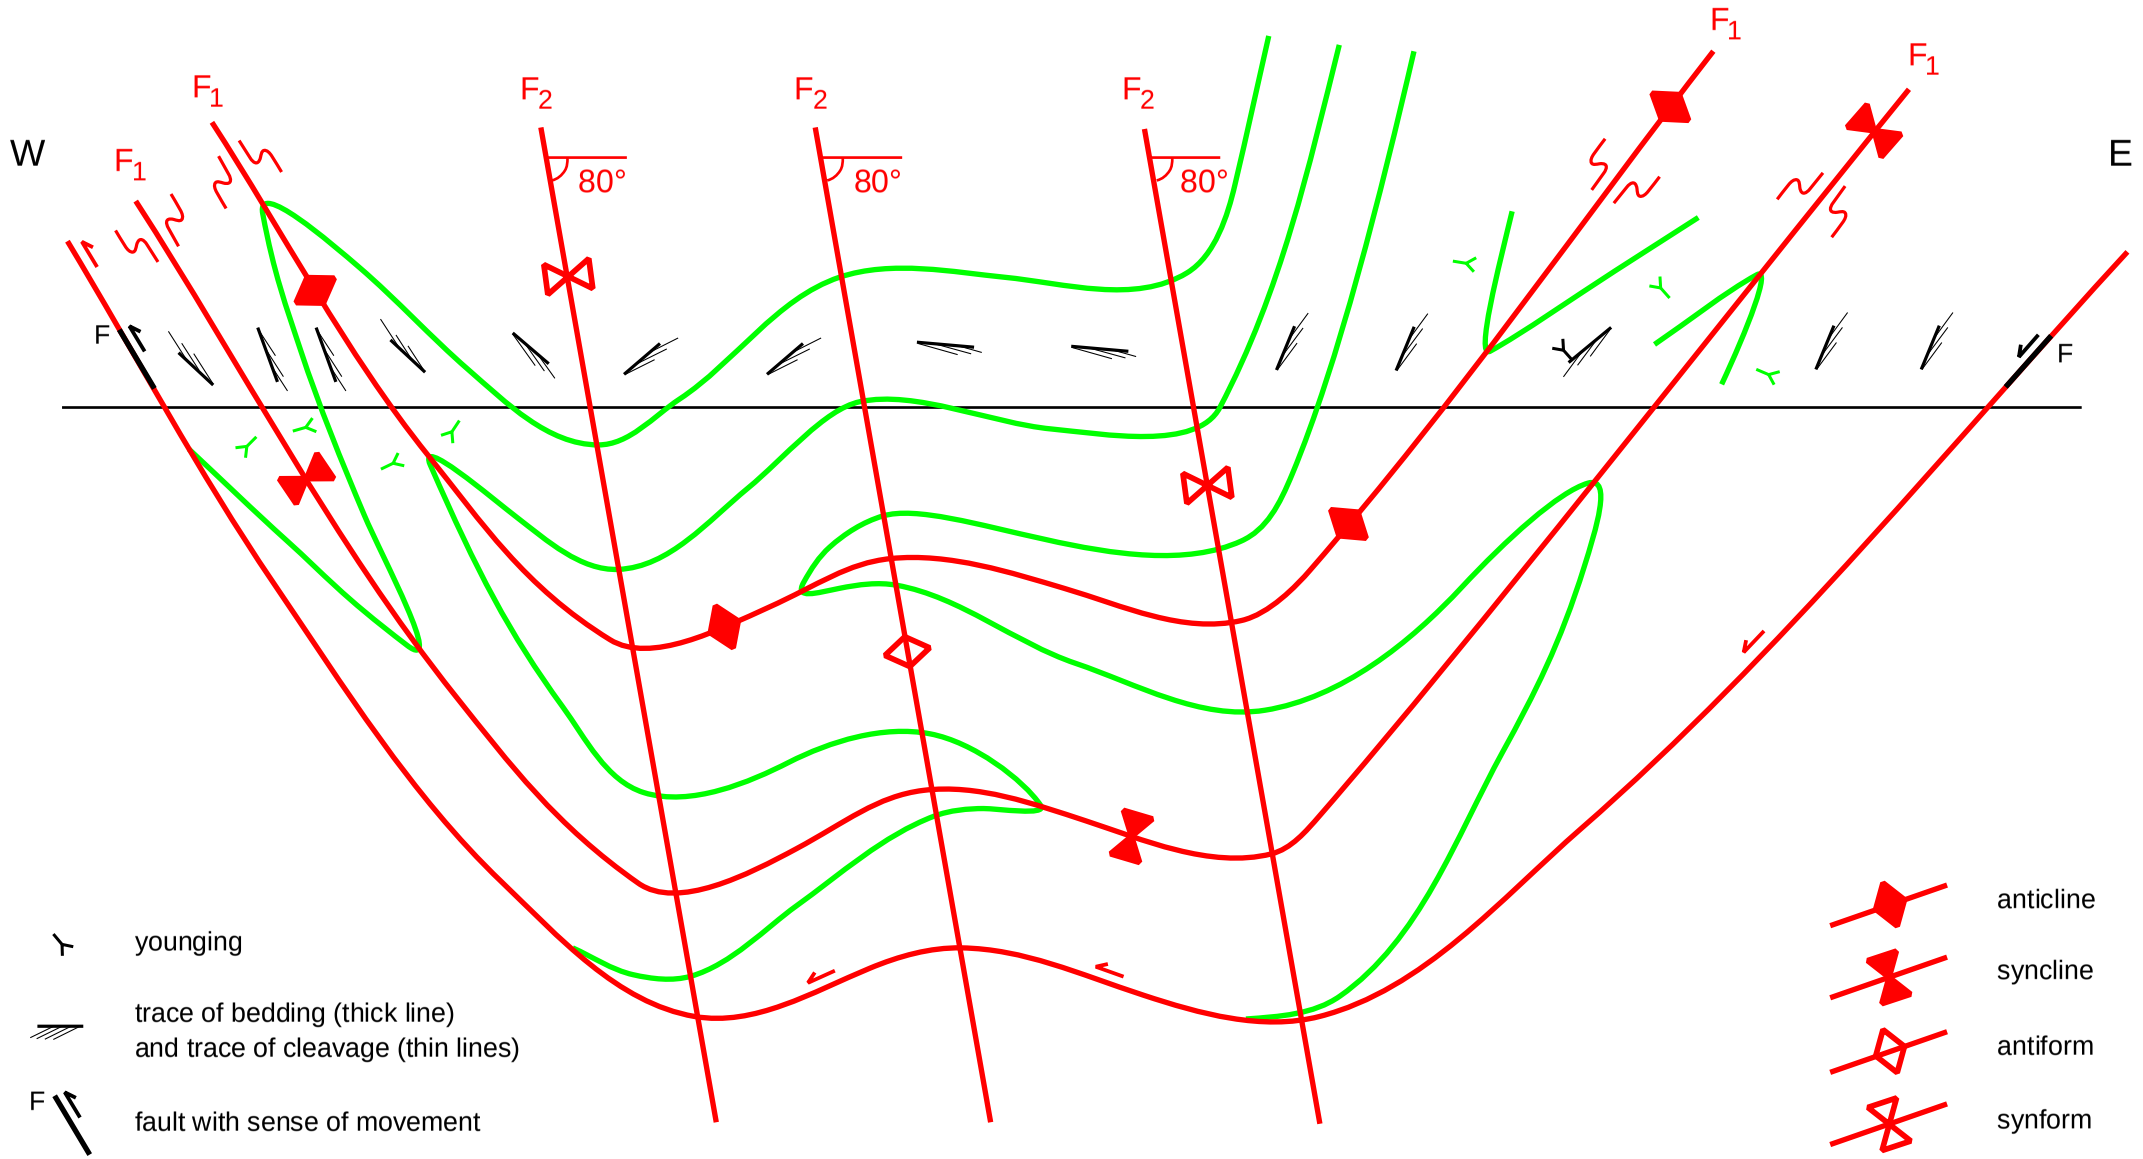
CONSTRUCTING SECTIONS THROUGH FOLDED SEQUENCES


The diagram below shows a number of observations of the traces of bedding and cleavage as seen on vertical road cuts along a several kilometre long east-west road section. What is believed to be the same fault is observed at either end of the section. Younging has been noted at one locality, and in the central part of the section there is a crenulation cleavage which has an apparent dip of 80°E. Sketch a plausible section to illustrate the geometry of the folds present.
