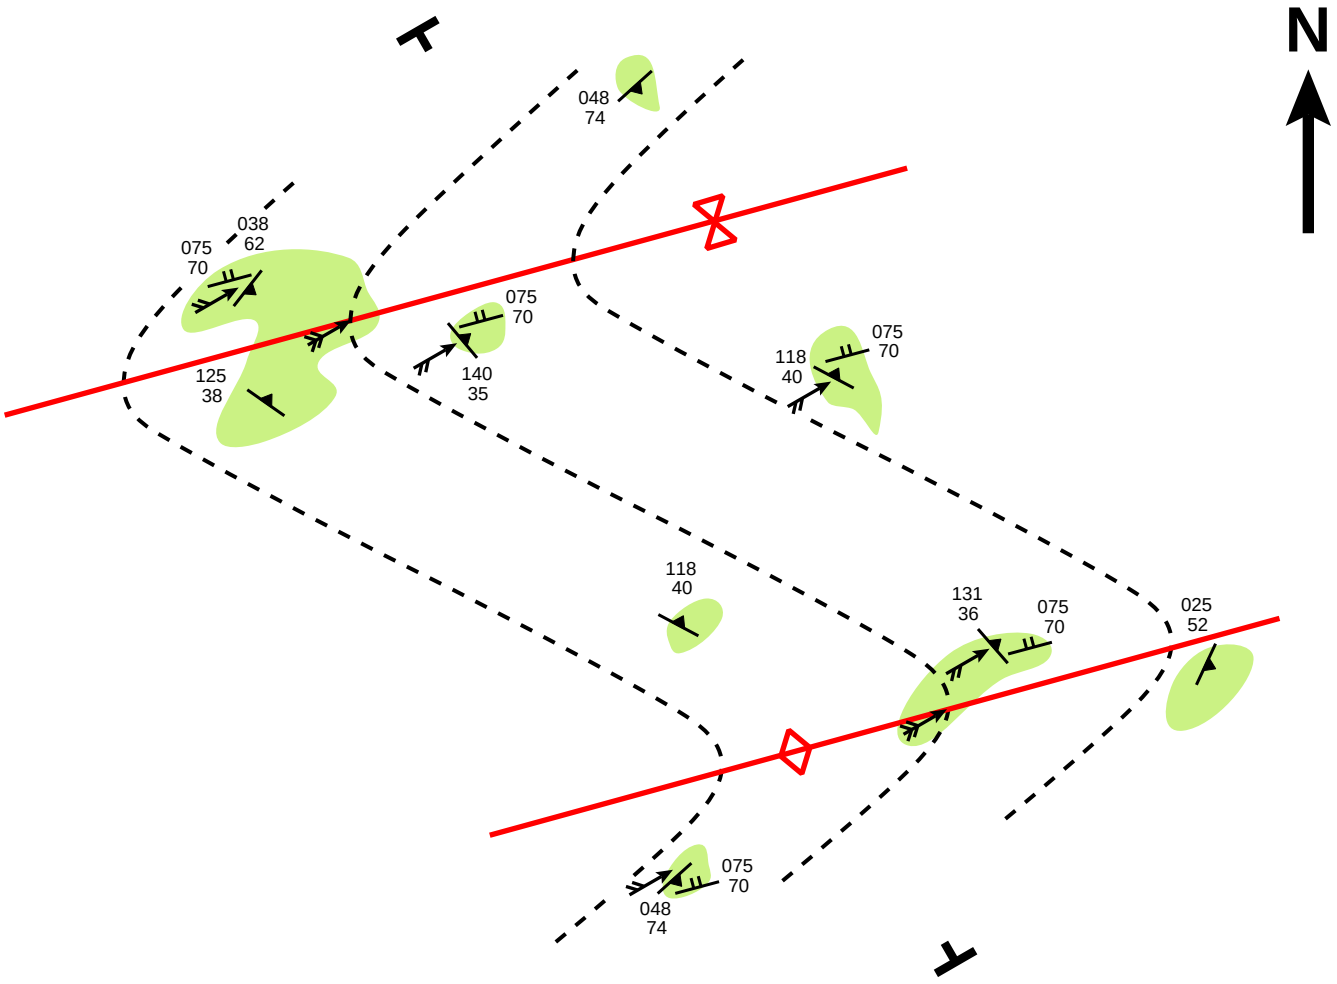
DOWN-PLUNGE SECTION EXERCISE

In an area of flat topography a number of exposures of a psammite unit were mapped. Bedding and crenulation cleavage measurements were taken in several places, and the asymmetry of the bedding/crenuation cleavage intersection lineation was noted. In addition, an early, nearly bedding-parallel, penetrative cleavage was everywhere observed to indicate an antiform to the north-west.

1. From the data shown below, construct an accurate down-plunge cross section, using form-lines to show the shape of the folded bedding.
2. Again using form-lines, show how the penetrative cleavage folds around the folds drawn in part 1.



Scale 1: 10000

045/62 strike/dip of bedding

045/62 strike/dip of crenulation cleavage

plunge direction of crenulation cleavage/bedding intersection lineation (tick towards antiform; double-sided ticks indicate the presence of symmetric minor folds with the crenulation cleavage being axial planar)
