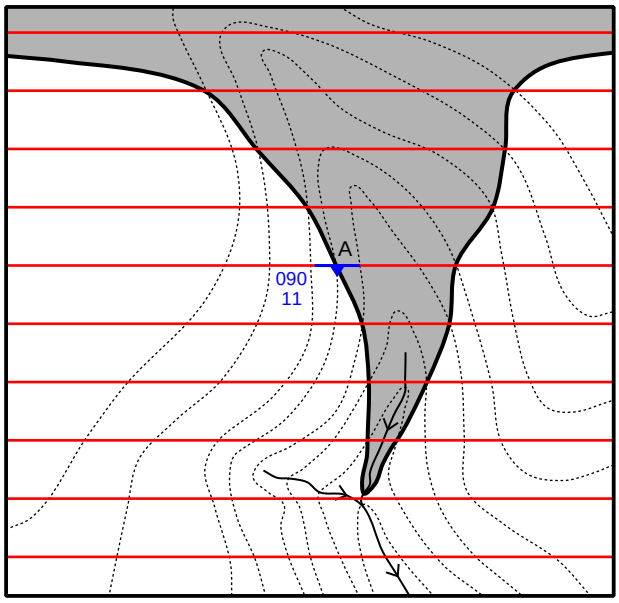
Stratum Contour Exercise 1

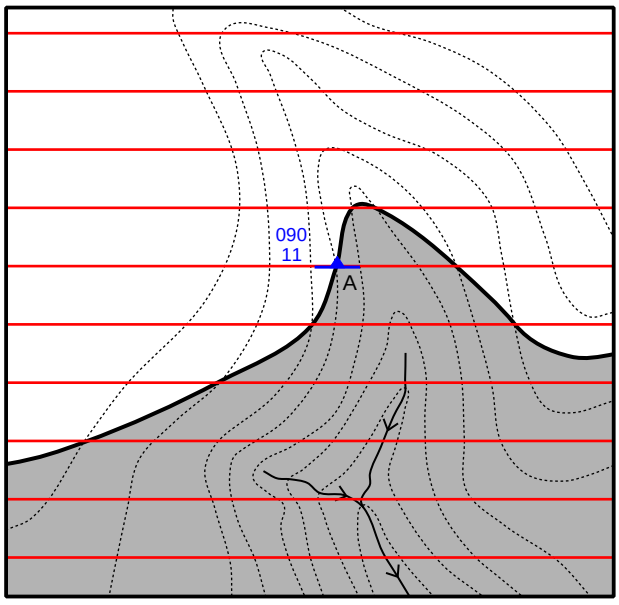
(location of contact in one place and its orientation)

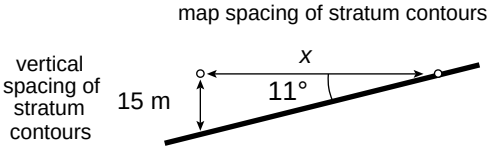
At locality A on the maps below, the contact between two mapping units is exposed. On Map A the bedding at locality A is oriented 090/11S while on Map B it is oriented 090/11N. Assuming that the beds dip uniformly, in each case determine the location of the contact on the ground surface, and shade that part of the map where the structurally lower unit outcrops.

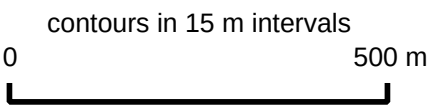
A



B







$x = 15 / \tan 11° = 77$ m
