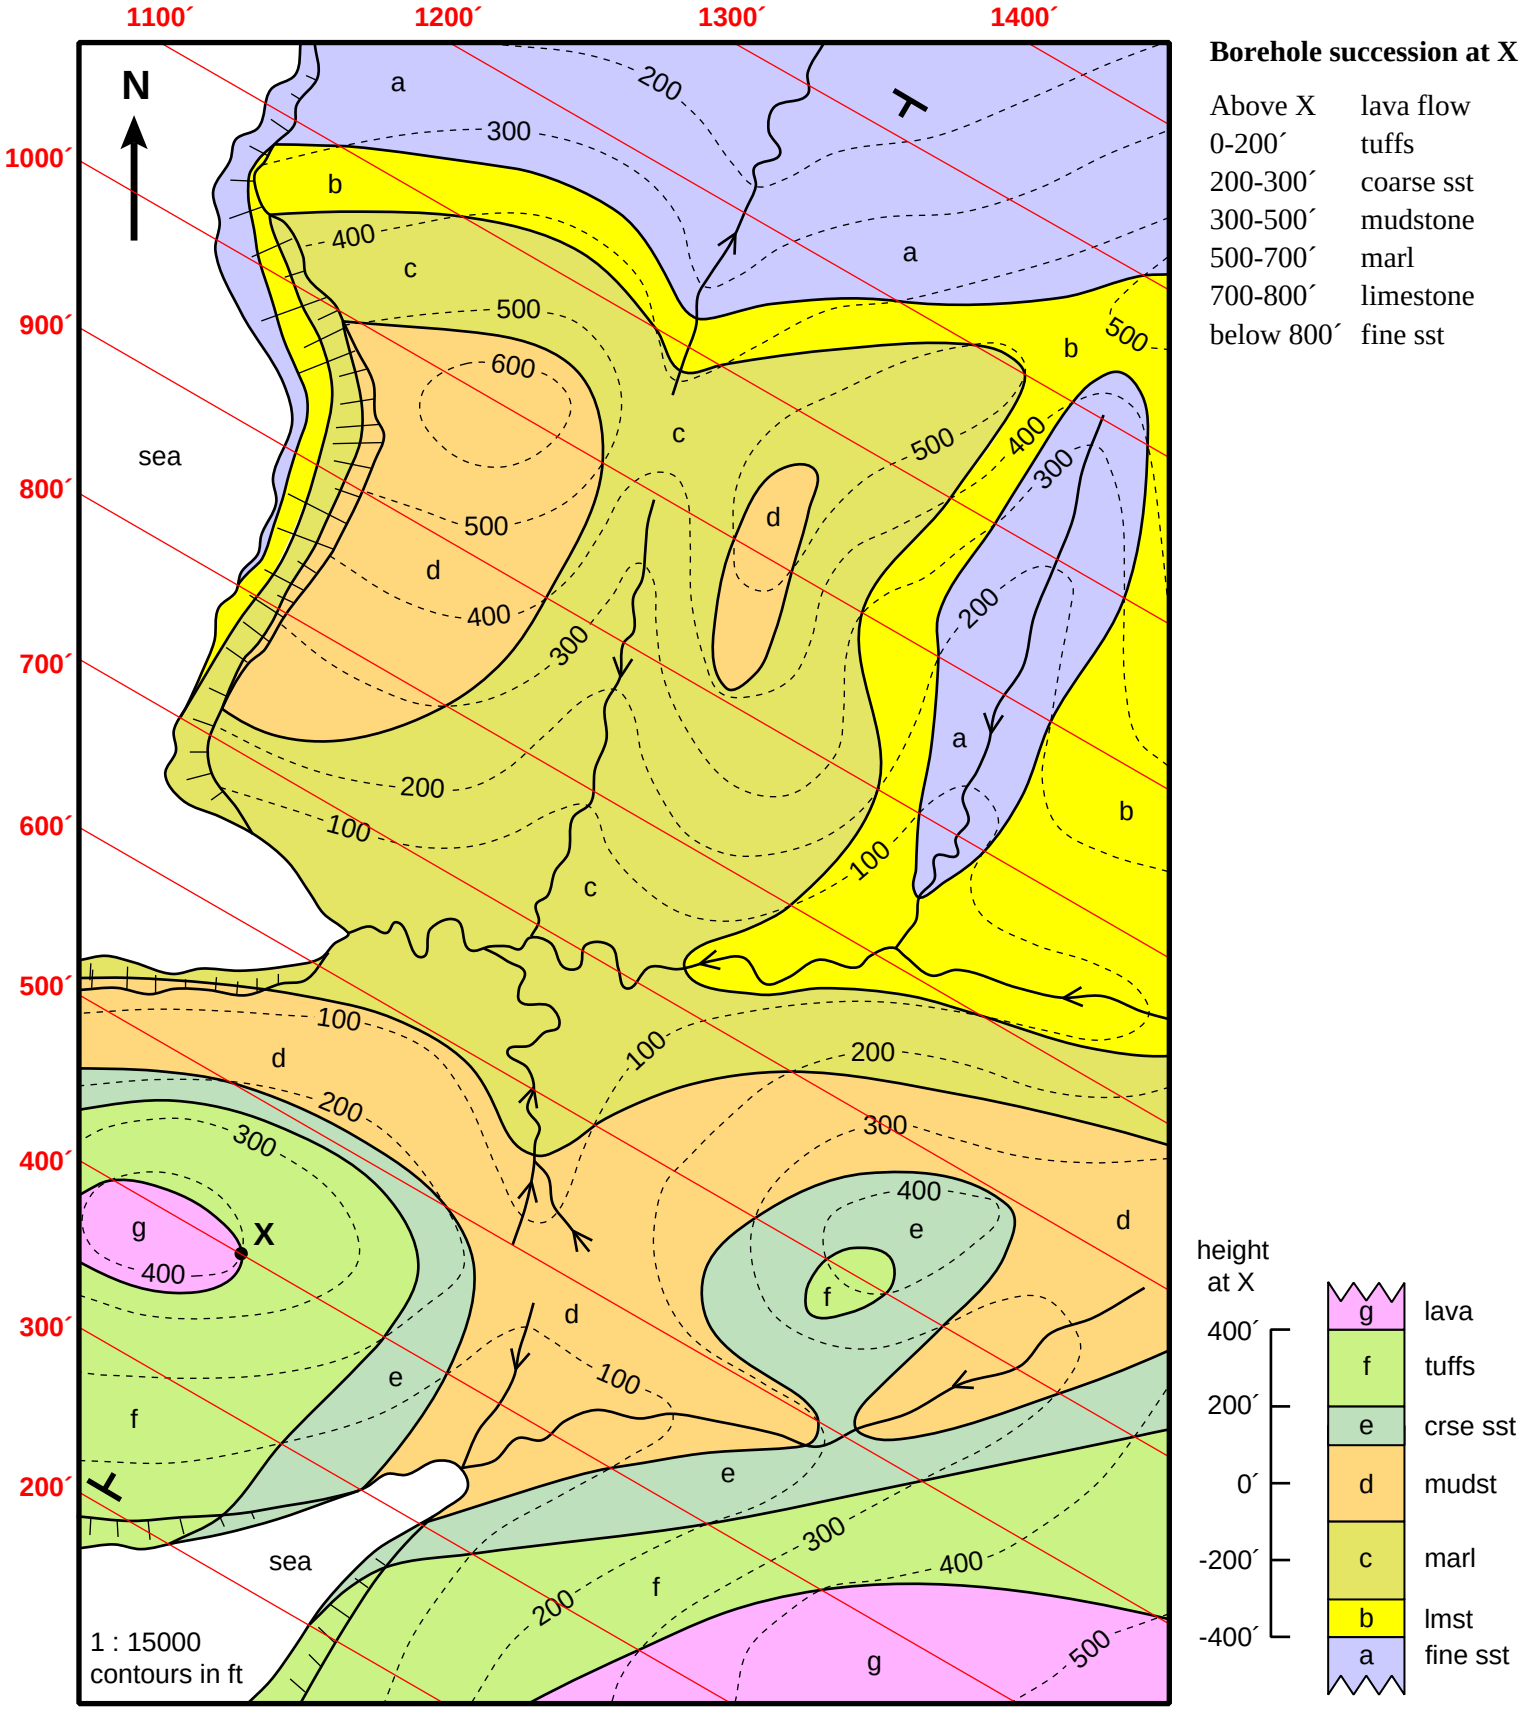
THE ORIENTATION OF SURFACES (2)

3. Completing a map given borehole and dip information

A borehole sunk at point X on the 400 ft contour revealed the succession indicated to the right of the map below. Across the area covered by the map, all the units dip uniformly at 120/6 SW.

(a) Draw a stratigraphic column showing the heights of the contacts above datum at X.

(b) Draw stratum contours for all of the lithological contacts on the map, and plot the outcrop pattern of these contacts.


(c) Draw a vertical cross section normal to the direction of strike which also passes through point X.
