FAULT PLANE (JUXTAPOSITION) SECTIONS

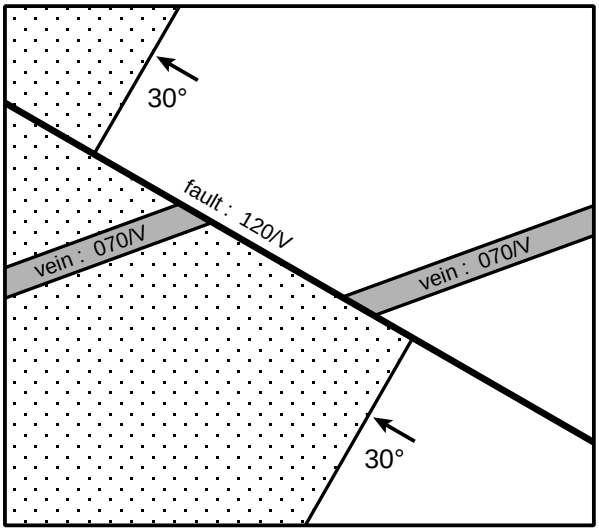
The map below shows a vein and a contact which have been offset by a fault. By drawing a fault plane cross-section fully determine

(a) the magnitude of the slip vector

(b) the magnitude and sense (down/up to the south or down/up to the north) of the dip-slip component of the slip vector

(c) the magnitude and sense (sinistral or dextral) of the strike-slip component of the slip vector

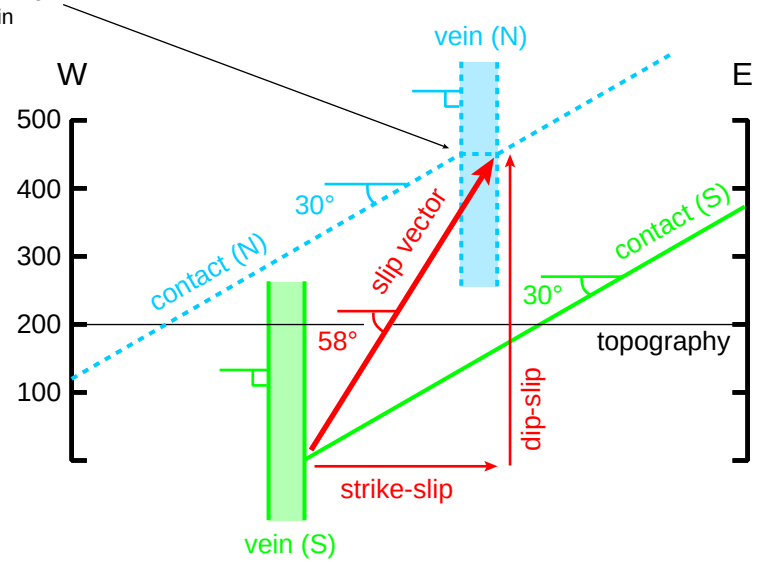
(d) the plunge/plunge direction of the slip vector



completely flat topography at an elevation of 200 ft

Note that we have had to assume the opening direction of the vein

Fault plane section: 120/V



Fault: 120/V; slip vector 58/300 , 530 ft

Dip-slip: 449 ft (up to north)

Strike-slip: 281 ft (dextral)
