FAULT EXERCISES

A

Fault plane section: 153 / V

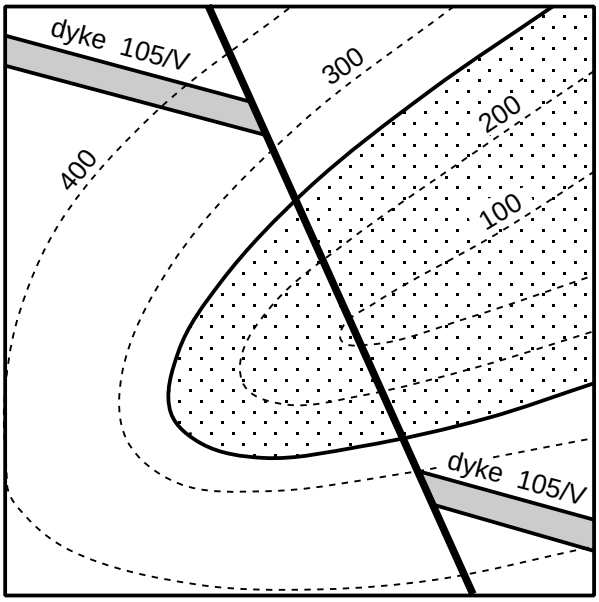

Fault: 153 / V ; slip vector: 90° , 267 m

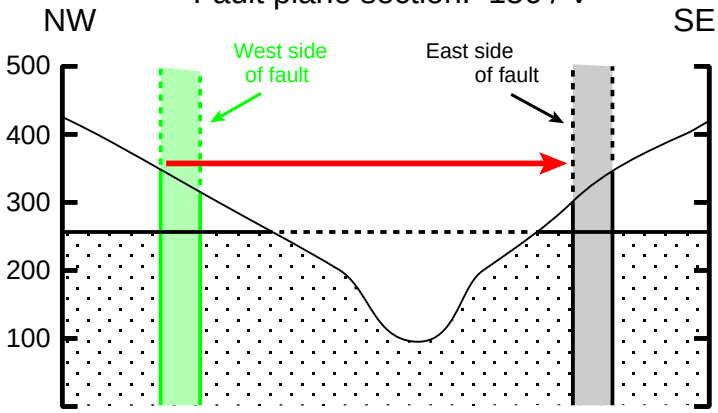

Dip-slip: 267 m (down to E) ; strike-slip: 0 m

We can only solve this question by assuming the opening direction of the dyke (here it is assumed that it opened normal to its margins)

B

Fault plane section: 156 / V

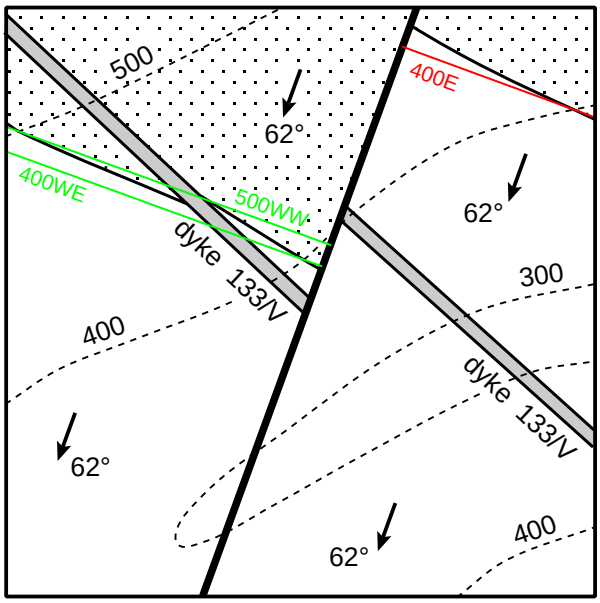

Fault: 156 / V ; slip vector: 0 / 156 , 600 m

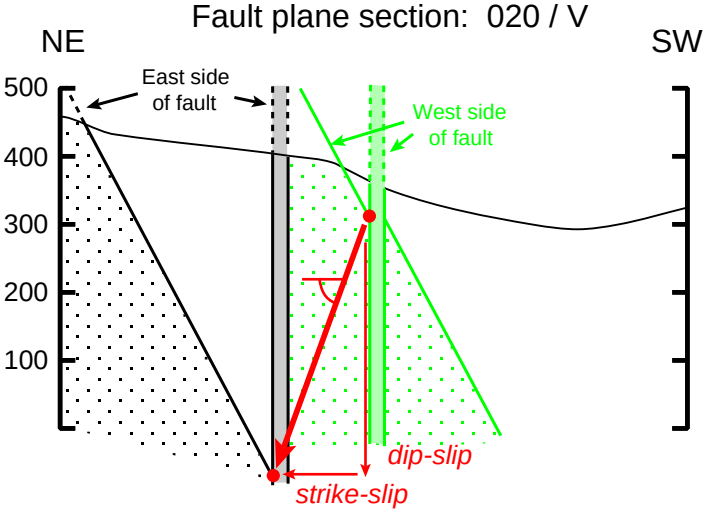

Dip-slip: 0 m ; strike-slip: 600 m (dextral)

Measure slip vector off map (cross-section unnecessary) but note that if the cut-offs were different topo heights a trig correction needed

C

Fault plane section: 020 / V

Fault: 020 / V; slip vector 70 / 020 , 409 m

Dip-slip: 384 m (down to E)

Strike-slip: 140 m (sinistral)
