Barrême (modified) exercise

045 37 bedding with younging

045 37 axial plane of minor fold

28 225 plunge of minor fold axis

28 225 palaeocurrent line of flow

form-lines (shown as dashed in unit LS)

0 1000 m

Locate the unconformity and plot a stereogram of the bedding readings, distinguishing readings above and below the unconformity using different colours. Add the fold axis and axial plane readings

- Satisfy yourself that the minor folds are congruent with the larger scale folding. Why is the plunge direction of the minor fold axes not the same as the strike of the axial plane?
- Fully describe the geometry of the folding
- Draw fold axial traces on the map and label them fully
- What can you deduce about the geometry of the units below the unconformity

Now do the palaeocurrent part of this exercise
